

How to install AXES?

It depends on the distribution version of the package:

for CD distribution:

- AXES for MS-DOS: select directory AXES-A and run SETUP.EXE or INSTALL.BAT;
- AXES for Windows: select directory AXES-W and run SETUP.EXE

for a network distribution:

- Extract all setup files from self extracting archive AXESxxxx.exe. Run SETUP.exe.

For AXES evaluation add-on package (axesWxxE.exe, where xx is version number of AXES):

- copy the self-extracting file axesWxxE.exe to the directory where AXES-W (both DEMO or full version) is already installed;
- run the self-extracting archive;
- run program AXES_WE.exe (or AXES_W.exe).

For AXES demo version (axesWxxd.exe, where xx is version number of AXES):

- copy the self-extracting file axesWxxd.exe to a temporary directory;
- run axesWxxd.exe;
- installation of AXES should start automatically;
- if it does not start, then run SETUP.exe from the temporary directory.

Usually, a new update of AXES does not accept parameters of AXES system from a previous STATE file: \STATE*.PAR. In case the updated version of AXES shows error by starting or by opening Options of AXES then you have to exit AXES, delete the *.PAR file and run AXES_W.exe again.
