

How to install Service Pack (or Version Update) for AXES?

1. You have received a Service Pack which is in a following file AX-xyySP.exe, where xx is version number of AXES and y is number of the service pack. If y=0 then this file contains a version update for AXES.
2. Copy the self-extracting file AX-xyySP.exe to the directory where AXES-W is already installed.
3. Make a copy of all files in the following subfolders of your AXES installation folder:
 - \CONST*.*
 - \STATE*.*
 - \GRAPH\TEMPLATE*.*
 - \HELP*.*New installation will overwrite some of files in these folders and in case you later need the old files then you can restore them from the backup.
4. Execute the self-extracting file AX-xyySP.exe. Service Pack installs all required files automatically.
5. Usually, a new update of AXES does not accept parameters of AXES system from a previous STATE file: \STATE*.PAR. In case the updated version of AXES shows error by starting or by opening Options of AXES then you have to exit AXES, delete the *.PAR file and run AXES_W.exe again.

Note!

Please read the help of axes (Help -> what's new) about new features and new commands of AXES before you start data processing.
